

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

THE  
NAUTICAL ALMANAC  
AND  
ASTRONOMICAL EPHEMERIS,  
FOR THE YEAR 1777.

Published by ORDER of the

COMMISSIONERS OF LONGITUDE.

L O N D O N :

PRINTED BY WILLIAM RICHARDSON,  
PRINTER;

AND SOLD BY

J. NOURSE, in the Strand, and Mess. MOUNT and PAGE  
on Tower-Hill,

Booksellers to the said COMMISSIONERS  
M DCC LXXVI.

[Price Three Shillings and Six P

[1776]

EXTRACT from the Act of Parliament  
concerning the Longitude, made in the  
Fifth Year of the Reign of his present  
Majesty.

WHEREAS the Publication of Nautical Almanacs  
constructed by proper Persons, under the Direc-  
tion of the said Commissioners, would greatly contribute  
to make the said Lunar Tables more generally useful; Be  
it further Enacted, by the Authority aforesaid, That it  
shall and may be lawful to and for the said Commissioners  
to cause such Nautical Almanacs, or other useful Tables,  
to be constructed, and to print, publish, and vend, or cause  
to be printed, published, and vended, any Nautical Alma-  
nac or Almanacs, or other useful Table or Tables,  
which they, or the major Part of them, shall, from time  
to time, judge necessary and useful, in order to facilitate  
the Method of discovering the Longitude at Sea; any  
Law, Statute, exclusive Privilege, private Charter, or  
other Custom, to the contrary thereof notwithstanding.

And be it Enacted, by the Authority aforesaid, That no  
Person or Persons shall print, publish, or vend, or cause to  
be printed, published, or vended, any Nautical Almanac  
or Almanacs, or other Table or Tables constructed under  
the Direction of the said Commissioners, without being first  
licensed by the said Commissioners, or the major Part of  
them: And if any Person or Persons not so licensed, or  
not being authorized by the Person or Persons so licensed  
by the said Commissioners, shall print, publish, or vend,  
or cause to be printed, published, or vended, any such  
Nautical Almanac or Almanacs, or other Table or  
Tables; every such Person or Persons shall, for every Copy  
of such Nautical Almanac or Table so printed, pub-  
lished, or vended, forfeit and pay the Sum of Twenty  
Pounds; to be recovered by Action of Debt, Bill, Plaintiff,  
or Information, in any of his Majesty's Courts of Record  
at *Westminster*; and that One Moiety of such Penalty and  
Forfeiture shall be to his Majesty, his Heirs and Success-  
ors, and the other Moiety to him or them that shall pro-  
secute, inform, or sue for the same.

EXTRACT of an Act for the Repeal of all former  
Acts concerning the Longitude at Sea, except so  
much thereof as relates to the Appointment and  
Authority of the Commissioners thereby consti-  
tuted, and also such Clauses as relate to the con-  
structing, printing, publishing, vending, and  
licensing of Nautical Almanacs and other use-  
ful Tables; and for the more effectual Encou-  
ragement and Reward of such Person and Per-  
sons as shall discover a Method for finding the  
same, or shall make useful Discoveries in Navi-  
gation; and for the better making Experiments  
relating thereto: Made in the Fourteenth Year  
of the Reign of his present Majesty.

**B**E it Enacted by the KING's Most Excellent Majesty, by  
and with the Advice and Consent of the Lords Spirit-  
ual and Temporal, and Commons, in this present Par-  
liament assembled, and by the Authority of the same, That  
each and every of the said recited Acts (save and except  
such Clause and Clauses in each or any of them as relate to  
the Appointment or Authority of all or any of the Com-  
missioners thereby respectively constituted, and also such  
Clause and Clauses as relate to the constructing, printing,  
publishing, vending, and licensing of Nautical Almanacs,  
and other useful Tables) shall, from and after the Twenty-  
fourth Day of *June* One thousand Seven hundred and Se-  
venty-four, be, and are hereby repealed.

And, for a due and sufficient Encouragement to any  
Person or Persons who shall discover any Method or Me-  
thods for finding the said Longitude, Be it Enacted by the  
Authority aforesaid, That the First Author or Authors,  
Discoverer or Discoverers, of each and every such Me-  
thod or Methods, his or their Executors, Administrators,  
or Assigns, shall be intitled to and have the Rewards or  
Sums of Money herein-after mentioned; that is to say, In  
case the Method proposed shall be, by means of a Time-  
keeper, the Principles whereof have not hitherto been  
made public, to the Reward or Sum of Five thousand  
Pounds,

## EXTRACT, &c.

Pounds, if such Method determines the said Longitude to One Degree of a great Circle, or Sixty geographical Miles; to the Reward or Sum of Seven thousand Five hundred Pounds, if it determines the same to Two Thirds of that Distance; and to the Reward or Sum of Ten thousand Pounds, if it determines the same to One Half of the said Distance: Which respective Rewards shall be due and paid when such Method shall have been sufficiently tried by the following Experiments and Voyages to be made and performed by such Persons, and under such Restrictions, as the said Commissioners for the Discovery of Longitude at Sea respectively constituted by the above-recited Acts, or the major Part of them, shall think fit to appoint and direct; (that is to say), When and so soon as Two or more Time-keepers of the same Construction shall have been tried at the same Time, for the Space of Twelve Months, at the Royal Observatory at *Greenwich*, then in Two Voyages round the Island of *Great Britain*, in contrary Directions, and in such other Voyages to different Climates as the said Commissioners shall think fit to direct and appoint; and after their Return from such Voyages, or any of them, for such longer Time, at the said Observatory, not exceeding Twelve Months, as the said Commissioners shall judge necessary; and also when and so soon as the said Commissioners, or Two Thirds of them at the least, shall, after such Experiments and Voyages have been made and performed as aforesaid, have declared and determined that such Method is generally practicable and useful, and sufficiently exact to determine the Longitude at Sea within the Degrees or Limits aforesaid, in all Voyages for the Space of Six Months, (Impediments from cloudy and hazy Weather excepted); and also when and so soon as the Principles and Practice of such Method are fully discovered and explained to the Satisfaction of the said Commissioners, or Two Thirds of them at least; and such Author or Authors, Discoverer or Discoverers, shall have delivered up and assigned over to the said Commissioners, for the Use of the Public, the absolute Property of such Time-keepers as shall have been tried

## E X T R A C T, &c,

tried by such Experiments and Voyages as aforesaid, together with all Places, Descriptions, Theories, and Explanations belonging or relating to the same, and which shall contain the Whole of such Discovery of the Longitude; and in case the Method proposed shall be by means of improved Solar and Lunar Tables, then and in such Case the Author or Authors of such improved Solar and Lunar Tables, their Executors, Administrators, or Assigns, shall be intitled to and have the Reward or Sum of Five thousand Pounds, if such Solar and Lunar Tables shall prove sufficiently exact to shew the Distance of the Moon from the Sun and Stars in the Heavens within Fifteen Seconds of a Degree, answering to about Seven Minutes of Longitude, after making an Allowance of Half a Degree for the Errors of Observation; and when it shall appear to the Satisfaction of the said Commissioners, or Two Thirds of them at least, that such Tables are constructed intirely upon the Principles of Gravitation laid down by Sir Isaac Newton (except with respect to those Elements which must necessarily be taken from astronomical Observations), and also when the Truth of such Tables shall have been further confirmed and proved by Comparison with a Series of astronomical Observations made during a Period of Eighteen Years and a Half, which is deemed the Period of the Irregularities of the Lunar Motions; which Reward shall be due and paid, when the said Commissioners, or Two Thirds of them, at least, shall have declared and determined, that such Tables are sufficiently exact to shew the Distance of the Moon from the Sun and Stars in the Heavens, within the Limits above-mentioned; and also when the Author or Authors of such improved Solar and Lunar Tables, his or their Executors, Administrators, or Assigns, shall have delivered up and assigned over to the said Commissioners, for the Use of the Public, the absolute Right and Property to and in the same, together with the Theory relating thereunto; and in case any other Method shall be proposed for finding the Longitude at Sea besides those before-mentioned, that then and in such Case the First Author or Authors, Discoverer or Discoverers, of any

## EXTRACT, &c.

any such Method, his or their Executors, Administrators, or Assigns, shall be intitled to and have the Reward or Sum of Five thousand Pounds, if it shall determine the said Longitude within One Degree of a great Circle or Sixty geographical Miles; to the Reward or Sum of Seven thousand Five hundred Pounds, if it shall determine the same to Two Thirds of that Distance; and to the Reward or Sum of Ten thousand Pounds, if it shall determine the same to One Half of the same Distance; which respective Rewards shall be due and paid, so soon as the said Commissioners, or Two Thirds of them, at least, shall, after proper Trial have been made by their Appointment and Direction, have determined that such Method shall be generally practicable and useful for finding the Longitude at Sea within the respective Limits above mentioned.

And be it further Enacted, by the Authority aforesaid, That when and so soon as any such Method or Methods, for the Discovery of the said Longitude, shall be tried, as before-mentioned, and found practicable and useful at Sea, and sufficiently exact to determine the Longitude within any of the Degrees or Limits aforesaid, the said Commissioners, or Two Thirds of them, shall certify the same, under their Hands and Seals, to the Commissioners of the Navy for the Time being, together with the Name or Names of the Person or Persons who shall be the Author or Authors of such Method or Methods; and upon the Receipt of such Certificate, the said Commissioners of the Navy are hereby authorized and required to make out a Bill or Bills upon the Treasurer of the Navy for the respective Sum or Sums of Money to which the Author or Authors of such Proposal, his or their Executors, Administrators, or Assigns, shall be intitled by virtue of this Act; which Sum or Sums the said Treasurer is hereby required to pay to the said Author or Authors, their Executors, Administrators, or Assigns accordingly, out of any Money that may be in Hands unapplied to the Use of the Navy, according to the true Intent and Meaning of this Act.

And

## EXTRACT, &c.

And be it further Enacted by the Authority aforesaid, That the said Commissioners for the Discovery of Longitude at Sea, or any Five or more of them, shall have full Power and Authority to hear and receive any Proposal or Proposals that shall be made to them for discovering the said Longitude, or for making any other useful Improvement in Navigation; and in case the said Commissioners, or any Five or more of them, shall be so far satisfied of the Probability of any such Discovery or Improvement as to think it proper to cause Experiments to be made thereof, they shall certify the same, together with the Names of the Author or Authors of such Proposal or Proposals, under their Hands and Seals, to the Commissioners of the Navy, who are hereby authorized and required to make out a Bill or Bills upon the Treasurer of the Navy for any Sum or Sums of Money as the said Commissioners for the Discovery of Longitude at Sea, or any Five or more of them, shall think necessary for making such Experiments; which Sum or Sums the Treasurer of the Navy is hereby required to pay immediately to such Person or Persons as shall be appointed by the said Commissioners to make those Experiments out of any Money which shall be in his the said Treasurer's Hands unapplied as aforesaid.

And be it further Enacted, by the Authority aforesaid, That if any Person or Persons shall make any Discovery for finding the Longitude at Sea, which, though not of so great Use as to be intitled to any of the great Rewards above specified, shall nevertheless be adjudged by the said Commissioners for the Discovery of Longitude at Sea, or the major Part of them, to be of considerable Use to the Public, or shall make any other Discovery or Discoveries, Improvement or Improvements, useful to Navigation; then, and in such Case, such Person or Persons, his or their Executors, Administrators, or Assigns, shall, from time to time, have and receive such less Reward or Sum or Sums of Money as the said Commissioners, or the major Part of them, shall think reasonable; and certify accordingly, under their Hands and Seals, to the Commissioners of the

Navy,

## E X T R A C T, &c.

Navy, who are hereby authorized and required to make out a Bill or Bills upon the Treasurer of the Navy for any such Sum or Sums of Money, which the said Treasurer is hereby authorized and required to pay immediately to such Person or Persons, his or their Executors, Administrators, or Assigns, out of any Money that shall be in his the said Treasurer's Hands unapplied as aforesaid.

Provided also, and it is hereby further Enacted, That in case any Person or Persons who shall and may have received any Sum or Sums of Money, by virtue of this Act, as a Reward for any Method of discovering the Longitude at Sea, shall afterwards become intitled to any of the greater Rewards appointed by this Act, for or on account of the same Method ; that then, and in such Case, such Sum or Sums of Money as they shall or may have received as aforesaid shall be considered as Part of such greater Reward, and deducted therefrom accordingly ; and that no Person shall receive more in the Whole for any One Method for discovering the Longitude at Sea than the greatest Reward appointed for such Method by this Act.

By

By the COMMISSIONERS appointed by Acts  
of Parliament for the Discovery of the  
Longitude at Sea, &c. and for examining,  
trying, and judging of all Proposals, Ex-  
periments, and Improvements relating to  
the same.

WHEREAS we have employed proper Persons to  
compute Nautical Almanacs and Astronomical  
Ephemerides for the Years 1777 and 1778, which will  
greatly contribute to make the Lunar Tables constructed  
by the late Professor MAYER of Gottingen (which you  
have already printed with our Authority) more generally  
useful; and whereas we think fit to employ you to print the  
said Nautical Almanacs and Astronomical Ephemerides:  
We do therefore, in pursuance of the Power vested in us by  
Act of Parliament, hereby license, authorize, and empower  
you to cause the same to be printed, together with such  
other useful Tables for facilitating the Method of discovering  
the Longitude at Sea, as shall have been constructed  
under our Direction, and will be delivered to you by the  
Reverend Mr. NEVIL MASKELYNE, his Majesty's  
Astronomer Royal at Greenwich; and for so doing this shall  
be your sufficient Warrant. Given under our Hands and  
Seals the 28th Day of October 1775.

To Mr. WILLIAM  
RICHARDSON,  
Printer in *Salisbury-*  
*court, Fleet-street.*

## P R E F A C E.

THE Commissioners of Longitude, in pursuance of the Powers vested in them by Act of Parliament, present the Publick with the NAUTICAL ALMANAC and ASTRONOMICAL EPHEMERIS for the Year 1777, being the Eleventh Impression, to be continued annually; a Work which must greatly contribute to the Improvement of Astronomy, Geography, and Navigation. This EPHEMERIS contains every Thing essential to general Use that is to be found in any Ephemeris hitherto published, with many other useful and interesting Particulars never yet offered to the Publick in any Work of this Kind. The Tables of the Moon had been brought by the late Professor MAYER of Gottingen to a sufficient Exactness to determine the Longitude at Sea, within a Degree, as appeared by the Trials of several Persons who made Use of them. The Difficulty and Length of the necessary Calculations seemed the only Obstacles to hinder them from becoming of general Use: To remove which this EPHEMERIS was made; the Mariner being hereby relieved from the Necessity of calculating the Moon's Place from the Tables, and afterwards computing the Distance to Seconds by Logarithms, which are the principal and only very delicate Part of the Calculus; so that the finding the Longitude by the Help of the EPHEMERIS is now in a Manner reduced to the Computation of the Time, an Operation equal to that of an Azimuth, and the Correction of the Distance on account of Refraction and Parallax, which is also rendered very easy by either of the Two Methods invented by Mr. LYONS and Mr. DUNTHORNE, and published among the Tables

requisite

## P R E F A C E.

requisite to be used with the EPHEMERIS; or by either of the Two Methods annexed to the EPHEMERIS of 1772, being both Improvements of the Method which I formerly published in the BRITISH MARINER'S GUIDE and PHILOSOPHICAL TRANSACTIONS, the First by myself, and the Second by Mr. GEORGE WITCHELL; but still more so by the GENERAL TABLES for correcting the apparent Distance of the Moon and a Star or the Sun from the Effects of Refraction and Parallax, computed at great Expence by Order of the Commissioners of Longitude, and published under the Care of Dr. SHEPHERD, Plumian Professor of Astronomy and experimental Philosophy at CAMBRIDGE, in 1772.

By Desire of the Commissioners of Longitude, I drew up the Explanation and Use of the Articles contained in the EPHEMERIS, and the Instructions, with Examples, for finding the Longitude at Sea by the Help of the same. I also collected and calculated the Sixteen First Pages of Tables requisite to be used with the EPHEMERIS, and computed the Table of proportional Logarithms, which seemed to me absolutely necessary to clear this Method of any remaining Difficulty; and added Explanations of all the Tables, and a Correction, p. 49 and 50, which may be applied by the Curious to the Effect of Refraction on the Moon's Distance from a Star, found by Mr. LYONS, or any other Method, on account of the Barometer and Thermometer.

All the Calculations of the EPHEMERIS relating to the Sun were made from Mr. MAYER'S last manuscript Tables, received by the Board of Longitude.

## P R E F A C E.

Longitude after his Decease, which have been printed under my Inspection, and published in 1770; but the Calculations of the Moon were made in this EPHERIS, for the first time, from new Tables, improved from MAYER'S Tables, composed by Mr. CHARLES MASON, under my Direction, from Calculations made by Order of the Board of Longitude, upon the Series of lunar Observations made by the late Dr. BRADLEY, and published in the Nautical Almanac of 1774. In these new Tables, the Epoch of the Moon's mean Longitude is  $1''$  less, that of the Apogee is  $56''$  less, and that of the Ascending Node  $45''$  more, than in MAYER's printed Tables, and the Equations are calculated to Tents of a Second. Moreover, One new Equation is introduced, whose Argument is the mean Distance of the Moon from the Sun's Apogee, and Maximum  $16,4''$ . These new Tables, when compared with the above-mentioned Series of Observations, a proper Allowance being made for the unavoidable Error of Observation, seem to give always the Moon's Longitude in the Heavens correctly within 45 Seconds of a Degree; which greatest Error, added to a possible Error of One Minute in taking the Moon's Distance from the Sun or a Star at Sea, will at a Medium only produce an Error of 50 Minutes of Longitude.

The Calculations of the Planets were made from Dr. HALLEY's Tables; and the Eclipses of Jupiter's First and Second Satellites from the Tables of Mr. WARGENTIN, published by M. DE LA LANDE in 1759; and those of the Third and Fourth Satellites from Tables of the same

## P R E F A C E.

same farther improved by Mr. WARGENTIN, and annexed, the first, to the NAUTICAL ALMANAC of 1771, and the other to the CONNOISSANCE DES MOUVEMENTS CELESTES of 1766.

All the Articles of the EPHEMERIS were computed by Two separate Persons, and examined by a Third, except the Moon's Longitude, Latitude, Right Ascension, Declination, Semidiameter, and Parallax, which, for Noon, were computed by One Person, and for Midnight by another, and the Truth of these Calculations ascertained by means of Differences, which, for the Moon's Longitude, were carried as far as the Fourth Order.

NEVIL MASKELYNE,  
ASTRONOMER ROYAL.

GREENWICH,  
JAN. 12.

## I. APRIL 1777.

[37]

Days of the Month.	Days of the Week.	Sundays, Holidays, &c.	Phases of the Moon.	
			D.H.M.	
1	Tu.		New Moon —	7. 12. 18
2	W.		First Quarter —	14. 6. 1
3	Th.	Rich. Ep. Chich.	Full Moon —	22. 7. 52
4	F.	St. Ambrose.	Last Quarter —	30. 5. 18
5	Sa.			
6	Su.	1st Su. after Easter. Low	D. Other Phenomena.	
7	M.	[Sunday.]	2. $\text{2} \times \text{M}$ diff. Lat. 10'.	
8	Tu.		3. $\text{C} \gamma \text{W}$ 11 <sup>h</sup> . 38'.	
9	W.	Oxf. and Camb. Terms	4. $\text{C} \delta \text{W}$ 14 <sup>h</sup> . 37'.	
10	Th.	[begin.]	5. $\text{C} \iota \text{ad} \text{J} \text{W}$ 4 <sup>h</sup> . 23'.	
11	F.		6. $\text{C} \text{2 ad} \text{J} \text{W}$ 5 <sup>h</sup> . 6'.	
12	Sa.		7. $\text{C} \text{3 ad} \text{J} \text{W}$ 5 <sup>h</sup> . 13'.	
13	Su.	2d Sunday after Easter.	10. $\text{C} \text{1 ad} \text{J} \text{V}$ 12 <sup>h</sup> . 15'.	
14	M.	From Easter in 15 days	11. $\text{C} \zeta \text{V}$ 18 <sup>h</sup> . 20'.	
15	Tu.	[1 ret.]	12. $\text{C} \text{II}$ 9 <sup>h</sup> . 19'.	
16	W.	Easter Term begins.	13. $\text{C} \mu \text{II}$ 12 <sup>h</sup> . 34'.	
17	Th.		14. $\text{C} \nu \text{II}$ 15 <sup>h</sup> . 14'.	
18	F.		15. $\text{C} \zeta \text{II}$ 5 <sup>h</sup> . 51'.	
19	Sa.	Alphege.	16. $\text{C} \delta \text{G}$ 1 <sup>h</sup> . 51'.	
20	Su.	3d Sunday after Easter.	17. $\text{O}$ enters $\text{V}$ at 7 <sup>h</sup> . 7'.	
21	M.	From Easter in 3 weeks	18. $\text{C} \gamma \cong 22^h. 13'$ .	
22	Tu.	[2 ret.]	19. $\text{C} \text{II} \cong 2^h. 43'$ .	
23	W.	St. George.	20. $\text{C} \theta \cong 7^h. 41'$ .	
24	Th.		21. $\text{C} \delta \text{M}$ diff. Lat. 36'.	
25	F.	St. Mark.	22. $\text{C} \text{g Serpent. 1}^h. 23'$ .	
26	Sa.		23. $\text{C} \text{1 ad} \mu \text{P} 1^h. 26'$ .	
27	Su.	4th Sunday after Easter.	24. $\text{C} \text{o P} \text{o}^h. 3'$ .	
28	M.	From Easter in 1 month	25. $\text{C} \pi \text{P} 2^h. 27'$ .	
29	Tu.	[3 ret.]	26. $\text{C} \gamma \text{W} 19^h. 45'$ .	
30	W.		27. $\text{C} \delta \text{W} 22^h. 46'$ .

EXPLANATION and USE  
OF THE  
ARTICLES

Contained in the

ASTRONOMICAL and NAUTICAL EPHEMERIS.

**I**T may be proper first to premise, that all the Calculations are made according to apparent Time by the Meridian of the Royal Observatory at Greenwich. They are likewise adapted to apparent Noon, except where they are otherwise distinguished, as the Eclipses and Configurations of Jupiter's Satellites, the Moon's Places, &c, computed for Midnight, and the Distances of the Moon from the Sun and Stars for every third Hour; which are all computed to the apparent Times set down.

Apparent Time is that deduced immediately from the Sun, whether from the Observation of his passing the Meridian, from his Altitude observed at a Distance from the Meridian, or from his observed Rising or Setting. This Time is different from that shewn by Clocks and Watches well regulated at Land, which is called equated or mean Time. This will be explained when we come to treat of the Equation of Time.

The Day is here supposed, according to the Method of Astronomers, to begin at Noon, or 12 Hours later than the civil Day of the same Denomination, and to be counted up to 24 Hours, or the succeeding Noon, when the next Day begins. Thus the Day of the Month and the Hour of the Day are the same in this Method as in the civil Account at Noon, and from Noon till Midnight; but from Midnight till Noon they

frequently for such Observations; which if they happen to prove Occultations, and are carefully observed, will afford a certain Means of determining the Longitude of the Place of Observation.

The Days of the Oppositions, Quadratures, &c. of the Planets with Respect to the Sun, are Times at which they ought to be observed in fixed Observatories, for settling the Elements of their Orbits by a Series of several Years Observations.

The Two first Columns of the Second Page of the Month contain the Day of the Month and Week as before; next follow the Sun's Longitude, right Ascension in Time, Declination, and the Equation of Time, with the Difference from Day to Day.

The Longitude of the Sun is made use of in most of the succeeding Calculations of the Ephemeris, and may serve either to verify them, or to make other similar Calculations at a different Time of the Day. Particularly it may serve with the Help of the Moon's Longitude, to find the Distance of the Moon from the Sun at any Time, independent of the Distances contained in the Four last Pages of the Month. To find the Sun's Longitude at any Time different from Noon, Proportion must be made according to its daily Increase: Saying as  $24^h$  is to the Hour from Noon reckoned by the Meridian of Greenwich, so is the daily Variation of the Sun's Longitude, to a fourth Number; which added to the Sun's Longitude at the preceding Noon, gives the true Longitude at the given Time.

If the Time given be that of a Meridian different from Greenwich, it must be first reduced thereto, by adding or subtracting the Difference of Longitude turned into Time (at the Rate of One Hour to  $15^\circ$ , and One Minute of Time to 15 Minutes, or more briefly by Pages 6, 7, and 8, of the requisite Tables) according as the Place is to the West or to the East of Greenwich. Example: Suppose any one should want to know the Sun's Longitude, January 19, 1767, at  $4^h. 35'$ . being in  $21^\circ 19'$ . Longitude East of Greenwich. The Difference of Longitude turned into Time by Table Page 6, is  $1^h. 25'$  which subtracted from  $4^h. 35'$ . because the Place is East of Greenwich, leaves  $3^h. 10'$ . for the Time reduced to the Meridian of Greenwich. The Sun's Longitude the preceding Noon is,  $9^\circ. 29'. 18'. 2''$ . and the following Noon is,  $10^\circ. 0'. 19'. 4''$ . the Difference is,  $1^\circ. 1'. 2''$ , or  $61'. 2''$ . the daily Variation. Then say, as  $24^h$  is to  $3^h. 10'$ . so is  $61'. 2''$  to  $8'. 3''$ . which added to  $9^\circ. 29'. 18'. 2''$ . the Sun's Longitude on the preceding

preceding Noon, gives  $9^{\circ} 29' 26.5''$  the Sun's Longitude at the Time given. In like Manner any other of the following Articles is to be found by the Help of the Ephemeris,

The Sun's Longitude serves also to compute the Aberration of the fixed Stars and Planets.

The Sun's right Ascension in Time is useful to the practical Astronomer in regular Observatories, who adjusts his Clocks by sidereal Time. It is also useful to him for converting apparent into sidereal Time; as suppose that of an Eclipse of Jupiter's Satellites, in order to know at what Time it may be expected to happen by his Clocks: For this Purpose, the Sun's right Ascension at the preceding Noon, together with the Increase of right Ascension from Noon, must be added to the apparent Time of the Phænomenon set down in the Ephemeris.

The Sun's right Ascension in Time serves also to compute the apparent Time of a known Star's passing the Meridian: Thus subtract the Sun's right Ascension in Time at Noon from the Star's right Ascension in Time, the Remainder is the apparent Time of the Star's passing the Meridian nearly; from which the proportional Part of the daily Increase of the Sun's right Ascension for this apparent Time from Noon being subtracted, leaves the correct Time of the Star's passing the Meridian.

Hence the apparent Time may be found from an observed Altitude of a known fixed Star, suppose one contained Page 12 or 13 of the requisite Tables; as will be explained hereafter.

The Sun's right Ascension in Time is also useful for computing the Time of the Moon and Planets passing the Meridian, as will be shewn under their proper Articles.

The Sun's Declination is necessary to find the Latitude, whether at Sea or Land, from the Meridian Altitude observed; it is also requisite for finding the Latitude from Two Altitudes observed with the Interval of Time measured by a Watch; it serves for computing the Sun's Azimuth, having his Altitude and the Latitude of the Place given, in order to find the Variation of the Compass; it is required jointly with the Latitude of the Place and the Sun's horary Angle to compute his Altitude, if neglected to be observed at the Time of taking the Moon's Distance from the Sun for finding the Longitude, being useful to facilitate the Calculation of the Effect of Refraction and Parallax upon the Distance; it is also necessary to calculate the apparent Time from an observed Altitude of the Sun at a Distance from

from the Meridian, the Latitude being given; or to compute the Time of the Sun's Setting or Rizing; which, though a less accurate Method than the former of obtaining the Time, may yet be useful when that cannot be had. For any of these Purposes, the Sun's Declination must be found to the Time given nearly reduced to the Meridian of Greenwich, making Proportion according to the daily Increase or Decrease, in like Manner as was shewn with Respect to the Sun's Longitude.

The Equation of Time is a Correction, which added to or subtracted from the apparent Time (according to its Title at the Top of the Column) gives equated or mean Time, or that which should be shewn by a good Clock or Watch. Apparent Time is that which takes its Beginning from the Passage of the Sun's Centre over the Meridian of any Place; and had the Sun no Motion in the Ecliptic, or was his Motion reduced to the Equator or in right Ascension uniform, he would always return to the Meridian after equal Intervals of Time. But his apparent Motion in the Ecliptic being continually varying, and his Motion in right Ascension being rendered further unequal on Account of the Obliquity of the Ecliptic to the Equator, from these Causes it arises that the Intervals of his Return to the Meridian become unequal, and the Sun will gradually come too slow or too soon to the Meridian for an equable Motion, such as that of Clocks and Watches ought to be.

This Retardation or Acceleration of the Sun's coming to the Meridian is called the Equation of Time, and is contained in the last Column but One of Page 2d; and when applied according to its Title to the Apparent Time, or that deduced immediately from the Sun, gives the mean or equated Time, whence the Error of a Clock or Watch may be found, and, if required, it may be corrected.

If it is proposed to convert mean Time into apparent, this is done by a contrary Process, by applying the Equation of Time to the mean Time given, with its Title or Sign changed; *viz.* subtracting instead of adding, and adding instead of subtracting.

The Equation of Time being set down in the Ephemeris for the Noon at Greenwich, Proportion must be made according to the daily Difference, to find what it should be at any given Time reduced to the same Meridian, as in the preceding Articles. The last Column of this Page, containing the daily Differences of the Equation, is designed for this Purpose.

As often as it may be required to make any Calculations from astronomical Tables, and the Time given be apparent Time; it is necessary first to apply the Equation of Time thereto to convert it into mean Time, the Tables being disposed according to mean Motions. Thus the Articles contained in the Ephemeris answering to Noon were computed to  $0^h$ . increased, or 24 Hours diminished, by the Equation of Time: And the Moon's Places set down for Midnight were computed to  $12^h$ . increased or diminished by the Equation of Time.

What has been shewn concerning the Equation of Time chiefly respects the Astronomer, the Mariner having little to do with it in computing his Longitude from the Moon's Distances from the Sun and Stars observed at Sea with the Help of the Ephemeris, all the Calculations thereof being adapted to apparent Time, the same which he will obtain by the Altitudes of the Sun or Stars in the Manner hereafter prescribed.

But if Watches made upon Mr. John Harrison's or other equivalent Principles should be brought into Use at Sea, the apparent Time deduced from an Altitude of the Sun must be corrected by the Equation of Time, and the mean Time found compared with that shewn by the Watch, the Difference will be the Longitude in Time from the Meridian by which the Watch was set; as near as the Going of the Watch can be depended upon.

The Equation of Time was computed for the Ephemeris of 1767 from the Table, Page 3d of Mayer's Tables; but on Account of that Table being made only to the nearest Second without Decimals, and the Neglect of the small Equations of the Sun, the Calculations of that Article in the Year 1767, cannot always be depended upon nearer than Two Seconds. For the Year 1768 and the following Years it will be computed in the strict Manner explained in my Remarks upon that Subject, in the Philos. Transact. Vol. liv. P. 342 for the Year 1764; namely, by taking the Difference of the Sun's true right Ascension, and his mean Longitude corrected by the Equation of the Equinoxes in right Ascension, and turning it into Time at the Rate of  $1^h$ . to  $15'$ . &c. The Equation of Time will be additive or subtractive as the Sun's true right Ascension is greater or less than his mean Longitude.

The Semidiameter of the Sun, Page 3d, is necessary to reduce the observed Altitude of his upper or lower Limb to that of

of the Centre; also to reduce the observed Distance of the Moon's nearest Limb from the Sun's nearest Limb to the Distance of the Centres. It is also useful to Astronomers to verify or ascertain the Exactness of the Scale of their Micrometers, by Comparison with the Measure of the Sun's horizontal Diameter. This Practice is particularly useful in solar Eclipses, when the Distance of the Cusps or the Verse Sine of the unclipped Part has been measured with the Micrometer. The Semidiameters of the Sun in Mayer's Tables, on which all the Calculations respecting the Sun and Moon are made, suppose the Semidiameter at the mean Distance to be  $16^{\circ} 2''$ , 8. which Mr. Mayer says he deduced from above 130 Observations taken with his Six Foot mural Quadrant, which seemed to him not ill adapted to the Purpose. It may not be amiss to take this Opportunity to remark that the Quadrant here mentioned was given to the University of Göttingen by his late Majesty, and was made by Mr. John Bird after the Model of the Eight Foot mural Arch, which he finished for the Royal Observatory at Greenwich, and put up there in the Year 1750. Mr. Mayer made his Observations with his Six Foot mural Arch, from the Year 1756, to the Time of his Decease; with it he settled the mean Obliquity of the Ecliptic to the Beginning of the Year 1756, at  $23^{\circ} 28' 16''$ . which Dr. Bradley settled by his Observations made in the Years 1750 and 1751, at  $23^{\circ} 28' 18''$ . The Difference is agreeable to what ought to arise from the gradual Diminution of the Obliquity of the Ecliptic at the Rate of about  $\frac{1}{2}$  a Second in a Year. The same Instrument he also used in settling the Elements of his solar Tables; and it is most probable that with the same he settled his Table of Refractions at the End of his solar Tables; the Agreement of this Table with Dr. Bradley's, see Page 2d of requisite Tables, (being both suited to the same Temperature of the Air) is so great, that they seem rather like One and the same than Two different Tables.

The Time of the Sun's Semidiameter passing the Meridian, serves to reduce an Observation of a Tranfit of the preceding or subsequent Limb over the Meridian to that of the Centre, when only One was observed. It signifies a Portion of apparent Time, or even mean Time, the Difference being absolutely insensible upon so small an Interval. It is found thus: Increase the Sun's Semidiameter in the Ratio of the Cosine of his Declination to the Radius, to find his Semidiameter in right Ascension, which turned into Time at the Rate of 1'. to 15', and 1'' to 15''.  
Time

Time required. The Sun's Semidiameter in right Ascension is readily found by adding the Log. Cosine of his Declination to the logistic Logarithm of his Semidiameter, the Sum is the logistic Logarithm of his Semidiameter in right Ascension; which divided by 15 gives the Time of his Semidiameter passing the Meridian. If the Clock by which the Observation is made be regulated according to sidereal Time, this Quantity must be increased in the Ratio of 365 to 366, if great Precision is required.

From the Time of the Sun's Semidiameter passing the Meridian may be also found the Time of its passing the horizontal or vertical Wire of a Quadrant or Sextant, which on some Occasions may have its Use.—The hourly Motion of the Sun is useful in computing solar and lunar Eclipses; also in correcting the assumed Longitude of the Ship, in order to find the Time from an Observation of the Distance of the Moon from the Sun, independant of the Distances contained in the nautical Ephemeris; See British Mariner's Guide, Page 49, and Table at the End of the same, Page 25, which is also copied at Page 14 of requisite Tables. The Logarithm of the Sun's Distance is useful in the Calculation of the Places of the Planets and Comets. The Place of the Moon's Node signifies its mean Longitude, and is necessary for finding the Equation of the equinoctial Points both in Longitude and right Ascension, the Equation of the Obliquity of the Ecliptic, and the Deviations of the fixed Stars in right Ascension and Declination.

The Eclipses of Jupiter's Satellites are well known to afford the readiest, and for general Practice the best Method of settling the Longitudes of Places at Land; and it is by their Means principally that Geography has been so much reformed within a Century past, and the Position of the most distant Places determined to equal Accuracy with the nearest. It was hoped that some Means might be found of using proper Telescopes on Shipboard to observe these Eclipses, and could this be effected, it would be of great Service in ascertaining the Longitude of a Ship from Time to Time. In my Voyage to Barbadoes under the Direction of the Commissioners of Longitude, I made a full Trial of the late Mr. Irwin's Marine Chair proposed for this Purpose, but found it totally impracticable to derive any Advantage from the Use of it; and, considering the great Power requisite in a Telescope for making these Observations well, and the Violence as well as

Irregularities of the Motion of a Ship, I am afraid the complete Management of a Telescope on Shipboard will always remain among the Desiderata. However, I would not be understood to mean to discourage any Attempt founded upon good Principles to get over this Difficulty.

The Telescopes proper for observing the Eclipses of Jupiter's Satellites, are common refracting Telescopes, from 15 to 20 Feet, reflecting Telescopes of 18 Inches or Two Feet, and Telescopes of Mr. Dollond's Construction with Two Object Glasses from Five to 10 Feet; or, which are still more convenient, those of  $3\frac{1}{2}$  Feet, which he has lately found a Method of constructing with Three Object Glasses, which are as manageable as reflecting Telescopes, and perform as much as those which he makes of 10 Feet with Two Object Glasses.

The Eclipses of Jupiter's Satellites are observed by Astronomers at Land, as well in order to provide Materials for improving the Theories and Tables of their Motions, as for the sake of Comparison with the corresponding Observations which may be made by Persons in different Parts of the Globe, whereby the Longitude of such Places will be accurately ascertained. It is indeed to be lamented that Persons who visit distant Countries are not more diligent to multiply Observations of this Kind, for want of which, the Observations made by Astronomers on Shore lose Half their Use, and the Improvement of Geography seems to be at a Stand. But it is to be hoped that an Emulation will spring up among those who may have Opportunities of rendering so useful a Service to the Public, to incite them to watch diligently for the Occasions of observing these Eclipses carefully, particularly of the First and Second, which are most exact for the Purpose. The Eclipses carefully calculated and set down in the Ephemeris, will serve to advertise them and Observers in general of the Times when they should attend to these Observations. The Person who shall be under any Meridian different from Greenwich, must turn his Difference of Longitude into Time: See Table Page 6, 7, and 8, and add it to or subtract it from the Time of the Eclipse set down in the Ephemeris, according as he is to the East or West of Greenwich, to find the apparent Time at which the Eclipse will happen at his Meridian, nearly. He must further take care to regulate his Watch or Clock by apparent Time, or at least to know the Difference, as well in order to apprise him of the Time to look out for the

the Eclipse, as for ascertaining the apparent Time exactly at which he shall observe it. Equal Altitudes of the Sun or Stars taken with an astronomical Quadrant afford the best Means of regulating Clocks and Watches for occasional Observations; or they may be taken with a Hadley's Quadrant, by Reflection from a Basin of Water or Quicksilver, or from the Horizon of the Sea, if the Observer has an open Prospect, and is not elevated above 5 or 600 Feet above the Level of the Sea. But, if Opportunity does not admit of taking equal Altitudes, the Time may be determined from One Altitude taken in any of the Methods above mentioned, at least Two or Three Points of the Compass distant from the Meridian, but the nearer to the East or West the better, the Latitude of the Place being known, or being found by Observations of the Meridian Altitude of the Sun or Stars made on Purpose. It will be better to take several Altitudes in order to take a Mean of the Results for greater Certainty. The Manner of computing the apparent Time from the Altitude of the Sun or a Star, will be observed when we come to treat of the Method of finding the Longitude by the Observations of the Distance of the Moon from the Sun and Stars by the Help of the Ephemeris.

The Observer being in a Place whose Longitude is well known, should be settled at his Telescope Three Minutes before the expected Time of an Immersion of the first Satellite; Six or Eight Minutes before that of the second and third Satellites; and a Quarter of an Hour or more before that of the fourth Satellite; chiefly on Account of the Uncertainty of their Theories; but, if the Longitude of the Place is very uncertain, he must begin to look out for the Eclipse proportionably sooner: Thus if the Longitude of the Place is uncertain to 30 Degrees, answering to 12 Minutes of Time, he ought to fix himself to his Telescope 12 Minutes sooner than is mentioned above. Nevertheless when he has observed One Eclipse of any Satellite, and thereby found the Error of the Tables, he may allow the same Correction to the Calculations of the Ephemeris for several Months, which will advertise him very nearly of the Time of expecting the Eclipses of the same Satellite, and dispense with his attending so long.

The Immersions signify the Instant of the Disappearance of the Satellite by entering into the Shadow of Jupiter; and the Emerisions signify the first Instant of its Appearance at com-

ing out of the same. They generally happen when the Satellite is at some Distance from the Body of Jupiter, except near the Opposition of Jupiter to the Sun, when the Satellite approaches nearer to his Body. Before the Opposition of Jupiter to the Sun the Immersions and Emerisions happen on the West Side of Jupiter, and after the Opposition on the East Side; but if an astronomical Telescope be used, which reverses Objects, the Appearances will be directly the contrary. Before the Opposition, the Immersions only of the first Satellite are visible; and after the Opposition, the Emerisions only. The same is generally the Case with respect to the second Satellite; both the Phænomena of the same Eclipse are frequently observable in the Two outer Satellites. The Immersions and Emerisions marked with an Asterisk in the Ephemeris are those visible at Greenwich.

To know if an Eclipse will be visible in any Place, find if Jupiter is  $8^{\circ}$ , or  $10^{\circ}$  above the Horizon of the Place, and the Sun as much below it. This may be done near enough by a celestial Globe: Otherwise, the Time of the Sun's Rising and Setting may be found for any Latitude by a Table of semi-diurnal Arcs, contained in the popular Book called the Mariner's Compass Rectified, and many other Books; the Time of Jupiter's Rising and Setting may also be found from the Time of his passing the Meridian and Declination set down in the Ephemeris, with the Help of the same Table of semi-diurnal Arcs; adding or subtracting the semidiurnal Arc answering to the same Declination of the Sun: Remembering always that if Jupiter's Declination and the Latitude of the Place are of the same Denomination, the semidiurnal Arc will be more than Six Hours, and if they are of contrary Denominations, it will be less than Six Hours.

The Immersion or Emerion of any Satellite being carefully observed in any Place according to apparent Time, the Longitude from Greenwich is found immediately by taking the Difference of the Observation from the corresponding Time shewn in the Ephemeris, which must be turned into Degrees, &c. by Table Page 5, 7, and 8; and will be East or West of Greenwich, as the Time observed is more or less than that of the Ephemeris.

Example: Suppose an Emerion of the first Satellite should be observed at the Cape of Good-Hope, May 9, 1767, at  $70^{\circ} 46' 45''$ , apparent Time: The Time by the Ephemeris being

being  $9^{\text{h}}. 33'. 12''$ . the Difference is  $1^{\text{h}}. 13'. 33''$ . whence by Table Page, 6, 7, and 8, the Longitude of the Cape should be  $18^{\circ}. 23' 15''$ . East of Greenwich, because the Time supposed to be observed at the Cape is more than that of the Ephemeris.

It may not be useless here to observe that the Longitude of the Cape of Good Hope  $1^{\text{h}}. 13'. 33'' = 18^{\circ}. 23'. 15''$ . set down in the British Mariner's Guide, is that of the Town; the Latitude also belongs to the same; being both determined from the Observations of Messrs. Mason and Dixon, who went thither under the Direction of the Royal Society, and observed the Transit of Venus in the Year 1761. Hence, by the Help of the Charts, I find the Longitude of the Cape Point or Promontory  $18^{\circ}. 45'$ . East of Greenwich, and its Latitude  $34^{\circ}. 30'$ . S. the Longitude of Cape Falso,  $19^{\circ}. 15'$ . E. and its Latitude  $34^{\circ}. 34'$ . S. If these Determinations of the Situations of the Cape Point and Cape Falso are in any respect uncertain, it arises from the Imperfection of the Charts I was obliged to make use of, in reducing the Longitude and Latitude from the Cape Town to the Two mentioned Points: For from the near Agreement of the Abbé de la Caille's Observations with those of Messrs. Mason and Dixon, it is probable that the Situation of few Places is better determined than that of the Cape Town: But if any one has Possession of any Manuscript or printed Charts of these Parts that he thinks may be depended upon, or has any Opportunity of determining the Points in Question relatively to each other from the Comparison of several Journals of Ships, he may perhaps fix these Places with more Certainty than is here pretended to.

It is to be observed that a correspondent Observation of an Eclipse of a Satellite of Jupiter, made under a well known Meridian, is to be preferred to the Calculations of the Ephemeris for comparing with an Observation made in a Meridian whose Longitude is required; but if no corresponding Observation can be obtained, as is frequently the Case, it will be best to find what Correction the Calculations of the Ephemeris require by the nearest Observations to the given Time that can be obtained; which Correction applied to the Calculation of the given Eclipse in the Ephemeris, renders it almost equivalent to an actual Observation.

The Longitudes and Latitudes of the Planets, Page 4, serve to know where to look for them in the Heavens, and when

when their Places may be conveniently settled by comparing them with fixed Stars by the Help of a Micrometer in a Telescope. They also shew when they are in the most important Points of their Orbits, where it is most material to observe them. They also serve to enable Persons less skilled to distinguish them from the fixed Stars. Their Declinations and apparent Time of passing the Meridian are particulary useful to Astronomers who are furnished with Quadrants and Transit Instruments well fixed in the Meridian, in setting their Instruments for observing their right Ascensions and Declinations.

The apparent Time of a Planet's passing the Meridian may be computed thus; the Planet's right Ascension being calculated from its Longitude and Latitude, and turned into Time, subtract the Sun's right Ascension at Noon in Time from it, to find the Time of the Planet's passing the Meridian nearly, which call  $T$ ; take the Difference of the  $\odot$  and Planets daily Variations in right Ascension in Time; if the Planet is progressive in right Ascension, or the Sum if it is retrograde, which call  $X$ ; then say, by the Rule of Proportion;

As  $24^h \mp X : T :: e$  and  $T \pm$  will be the correct Time of the Planet's passing the Meridian. The upper Signs are to be used both to  $X$  and  $e$  if the Planet's progressive Motion in right Ascension be greater than that of the Sun; in any other Case the lower Signs are to be made use of.

But perhaps it may be found more readily by continual Approximation as follows: Take the proportional Part of the Difference or Sum of the  $\odot$  and Planet's daily Motion in right Ascension, answering to the Time of the Planet's passing the Meridian, found nearly, in Proportion to  $24^h$ . and take a further like proportional Part of this proportional Part; and again of this last, and so on as far as is necessary. The Sum of all these proportional Parts added to the Time of the Planet's passing the Meridian found nearly, if the Planet's progressive Motion in right Ascension is greater than that of the Sun, otherwise subtracted, gives the apparent Time of the Planet's passing the Meridian.

Example: Let it be required to find the Time of the Moon's passing the Meridian, July 1 1767.

The Sun's right Ascension in Time July 1st is,  $6^h. 40'. 25''$ . and July 2d,  $6^h. 44'. 33''$ . by the Ephemeris. Therefore his daily Motion in right Ascension is  $4'. 8''$ . The Moon's right Ascension July 1st at Noon by the Ephemeris, is  $159^{\circ}. 2'$ , answering to  $10^h. 36'. 8''$ . of Time, and July 2d is,  $169^{\circ}. 39'$ . answering

swering to  $10^h. 18'. 36''$ . The Difference is,  $42'. 28''$ . of Time, from which  $4'. 8''$ . being substracted leaves  $38'. 20''$ . Subtract  $6^h. 40'. 25''$ , the Sun's right Ascension July 1st, at Noon from  $10^h. 36'. 8''$ , the Moon's right Ascension the same Noon, the Remainder  $3^h. 55'. 43''$ . is the Approximate Time of the Moon's passing the Meridian. The proportional Part of  $38'. 20''$  answering to this, is  $6'. 17''$  and the proportional Part of  $6'. 17''$ . is  $9''$ ; therefore  $6'. 17''$  and  $9''$  or  $6'. 26''$  added to  $3^h. 55'. 43''$  give  $4^h. 2'. 9''$ , the apparent Time of the Moon's passing the Meridian. In the Ephemeris it is  $4^h. 2'$ . It may also be computed by taking the Difference of the Moon's right Ascensions at Noon and Midnight, but then half the Sun's daily Variation in right Ascension must be made use of, and Proportion must be made for 12 instead of 24 Hours: And if the Moon passed the Meridian after Midnight, the Sun's right Ascension at Midnight must be used, which is a Mean between his right Ascensions on the preceding and subsequent Noon. For the Planet's, it will be sufficient to take the first proportional Part only.

The Configurations of Jupiter's Satellites, Page 5, exhibit the apparent Positions of the Satellites with respect to each other, and to Jupiter at such an Hour of the Evening or Night as they are most likely to be observed, and serve to distinguish the Satellites from one another. Jupiter is distinguished by the Mark  $\circ$ , and the Satellites by Points with Figures annexed, the Figure 1 signifying the first Satellite, 2 the second Satellite, &c. When the Satellite is approaching towards Jupiter, the Figure is put between Jupiter and the Point; and when the Satellite is receding from Jupiter, the Figure is put on the other Side of the Point. The Satellites are in the superior Parts of their Orbits, or furthest from the Earth, when they are marked to the right Hand or West of Jupiter approaching him; or to the left Hand or East of Jupiter receding from him; but are in the inferior Part of their Orbits, or nearest to the Earth, when they are marked to the right Hand or West of Jupiter receding from him, or to the left or East of Jupiter approaching him. The Cypher 0 sometimes annexed to the Figure of the Satellite towards the Margin, signifies that it is invisible on the Face of Jupiter; and the black Mark  $\bullet$ , signifies that it is invisible, being eclipsed in Jupiter's Shadow, or behind Jupiter, and eclipsed by his Body.

The 7th and 5 following Pages of each Month contain the Moon's Place, and all the Circumstances relating to her Motions,

tions, and her Distances from the Sun and proper Stars, from which her Distance should be observed for finding the Longitude at Sea. The Longitudes, Latitudes, and Declinations of the Moon, and Time of her passing the Meridian, afford the like Uses with the same Circumstances of the Planetary Motions, and many more besides. For the sake of greater Precision, the Moon's Longitude, Latitude, Right Ascension, Declination, Semidiameter, horizontal Parallax, with its logistic or proportional Logarithm, are computed twice a Day, to Noon and Midnight, and may readily be inferred to any intermediate Time with the greatest Exactness.

Example: Let it be required to find the Moon's Longitude and Latitude, &c. July 16, 1767, at 16<sup>h</sup>. 22<sup>m</sup>. 16<sup>s</sup>. First to find the Longitude. The Moon's Longitude, July 16, at 12<sup>h</sup>. is 0°. 6°. 40'. 25". and July 17 at Noon, 0°. 13°. 47'. 48". The Difference 7°. 7'. 23". is the Moon's Motion in 12 Hours; say then, by the Rule of Proportion,

As 12<sup>h</sup>. is to 4<sup>h</sup>. 22<sup>m</sup>. 16<sup>s</sup>. (the Excess of 16<sup>h</sup>. 22<sup>m</sup>. 16<sup>s</sup>. above 12<sup>h</sup>.) so is 7°. 7'. 23". to 2°. 35'. 41". which added to 0°. 6°. 40'. 25". the Moon's Longitude at 12<sup>h</sup>. gives 0°. 9°. 16'. 6", the Moon's Longitude nearly; but this must be corrected on Account of the Moon's unequal Motion in 12 Hours, by Page 11 of requisite Tables; for this Purpose take out of the Ephemeris the Two Longitudes of the Moon next preceding the given Time, and the Longitudes immediately following it, and set them down in Order one after another, as follows.

	1st Diff.	2d. Diff.
°    '	°    '	°    '
July 16, Noon 11. 29. 29. 34.	0. 1. 11	1. 11
Midnight 0. 6. 40. 58.	7. 10. 51.	3. 28.
17, Noon 0. 13. 47. 24.	7. 7. 23.	3. 44.
Midnight 0. 20. 51. 27.	7. 3. 39.	

Take their Differences, 7°. 10'. 51". 7°. 7'. 23". 7°. 3'. 39". take the Differences of these Differences, or the 2d Differences, 3°. 28". 3'. 44". and taketheir Mean which is 3°. 36". Now look for the Correction in Page 11 of requisite Tables answering to 4<sup>h</sup>. 22<sup>m</sup> after Midnight, found on the Side, and 3°. 36" at Top, 21" will be found under 3°. and 28" under 4°. the the Difference is 7". whence 35" will require 4", and the Correction sought is 21" + 4" = 25". which, according to the Remark at the Bottom of the Table, must be added (because

cause the Motion in 12 Hours or first Differences are decreasing to  $0^{\circ} 9^{\prime} 16^{\prime\prime} 6^{\prime\prime\prime}$ , the Moon's Longitude found by even Proportion; whence the Moon's true Longitude is  $0^{\circ} 9^{\prime} 16^{\prime\prime} 3^{\prime\prime\prime}$ , and is as correct as the Longitudes from which it is deduced.

N. B. If the first Differences of the Four Longitudes of the Moon taken out first increase and then decrease, or, vice versa, first decrease and then increase, take half the Difference of the Two second Differences for the Mean second Difference, with which take the Correction from Page 11, and add or subtract it as the 1st. first Difference is greater or less than the third first Difference.

To find the Moon's Latitude. Take out of the Ephemeris the Two Latitudes preceding and Two following the given Time, and set them down in Order, and take their first and second Differences, and the mean of the Two second Differences; find the proportional Part of the Middle first Difference answering to the Hours and Minutes, &c. of the given Time after Noon or Midnight; which correct in the following Manner: Entering Table Page 11 with the Hour from Noon or Midnight on the Side, and the mean second Difference at Top, take out the corresponding Number of Seconds, which added to or subtracted from the proportional Part found above, according as the Motion in 12 Hours or first Differences are decreasing or increasing; or, more generally, according as 1st first Difference is greater or less than third first Difference, gives the proportional Part corrected; which now added to or subtracted from the Moon's Latitude at the preceding Noon or Midnight, as the Latitude in these 12 Hours is increasing or decreasing, gives the Moon's Latitude correct.

Example: The Moon's Latitude is required, July 16, 16<sup>h</sup>. 22<sup>m</sup>. 16<sup>s</sup>.

D's Lat. by the Ephem.	1st Dif.	2d Dif.	Mean of 2d Dif.
$0^{\circ} 1^{\prime} 11^{\prime\prime}$	$1^{\prime} 11^{\prime\prime}$	$1^{\prime} 11^{\prime\prime}$	$1^{\prime} 11^{\prime\prime}$
July 16. Noon 4 31 10 N.	18 26	4 36	4 40
Midnight 4 49 36	13 50	4 44	
17. Noon 5 3 26	9 6		
Midnight 5 12 32			

The Moon's Latitude July 16 at Midnight being  $4^{\circ} 49' 36''$ , N. and the Motion in the next 12 Hours being  $13' 50''$ , say by Proportion;

As  $12^h$ . is to  $4^h. 22'$ . so is  $13'. 50''$ . to  $5'. 2''$ ; but this must be corrected by adding  $33''$ . the Correction from Page 11, answering to the Hour  $4^h. 22'$ . and the Mean Second Difference  $4' 40''$ , because the first Differences are decreasing, or rather because the first of them  $18'. 26''$ . is greater than the last of them  $9'. 6''$ . therefore the proportional Part corrected is  $5'. 2'' + 33'' = 5'. 35''$ , which added to  $4^{\circ} 49' 36''$ . gives  $4^{\circ} 55' 11''$ . N. the Moon's Latitude correct.

Remarks on some Circumstances necessary to be attended to, in order to obtain and apply the Correction of second Differences rightly in computing the Moon's Latitude.

I. If the Moon's Latitude taken out of the Ephemeris for Noon and Midn'ght changes its Denomination from North to South or from South to North, the Sum of the Two Latitudes of contrary Denominations, where the Change happens, is to be accounted the first Difference in that Place.

II. If the Three first Differences first increase and then decrease, or vice versa, first decrease and then increase, Half the Difference of the Two second Differences is to be taken for the mean second Difference.

III. If the Series of Four Latitudes taken out should first increase and then decrease about the Moon's greatest Latitudes, take the Sum of the Two first Differences standing on each Side of the greatest Latitude for the second Difference in that Place; correct the Moon's Latitude at Noon or Midnight by the simple proportional Part first found; and to the Latitude so corrected, add always in this Case the Correction from Table Page 11, answering to the Mean of the Two second Differences.

Before I quit this Subject of Interpolation by second Differences, I shall point out another Method, by which the same End may be obtained more readily, and with fewer Rules, by those who are well acquainted with algebraical Subtraction and Addition, and the Manner of applying the Signs in those Operations. Subtract each Latitude from the following for the first Differences, to which prefix the Sign — if the Latitudes decrease; and subtract each first Difference, thus found, from the following one of the same Order for the second Differences. Half the Sum of the Two second Differences

ferences standing on each Side of the Interval to be interpolated, is to be accounted the mean second Difference; the Correction corresponding to it by Table Page 11, is to be applied always with the contrary Sign.

These Operations are to be performed, and the Signs to be applied as in algebraic Subtraction and Addition. Note further, if the Four given Latitudes change their Denomination, call the second Latitude +, and those of a contrary Denomination —.

The Moon's Declination may be found at any Hour in the same Manner as her Latitude; but as the Correction arising from second Differences will never exceed  $2\frac{1}{2}'$ , this may be neglected on most Occasions: but if any one is desirous to obtain the Declination true to a Minute, the Correction is easily applied, as shewn above.

The other Articles of Page 7, and 8, *viz.* the Moon's right Ascension, her Semidiameter, horizontal Parallax, with its Logarithm, and the Distances contained in the Four last Pages of the Month, may be all found correctly by even Proportion, without requiring any Allowance on Account of second Differences. The proportional Part of the Moon's Longitude, &c. for any Hour, may be found very readily by the Help of the Table of proportional Logarithms at the End of the requisite Tables: For which consult the Explanation of those Tables.

The Moon's Longitude and Latitude are used in computing her Distances from the Sun and Stars contained in the Four last Pages of the Month, as well as in the Appulses to Stars pointed out in Page 1, and, jointly with her Parallax and Semidiameter, are necessary for computing the Eclipses of the Sun and Moon, and the Occultations of fixed Stars and Planets by the Moon. They also facilitate the Calculation of the Longitude of any Place from an Eclipse of the Sun, or an Occultation of a Star or Planet by the Moon observed: Or, if the Meridian be well known, the Parallax and Semidiameter serve to deduce the Moon's true Place in the Heavens from the Observation, which compared with that given by the Ephemeris shews the Error of the Tables, whatever it be at that Time. The Moon's Semidiameter and Parallax are applied in correcting almost all Observations of the Moon. The logistic Logarithms of the Moon's Parallax, serve further to facilitate the Calculations of Parallaxes, but if the Table of proportional Logarithms at the End of the requisite Tables be made use,

of, which will be most convenient; the constant Quantity 0.4771 must be added to the logistic Logarithms of the Moon's horizontal Parallax contained in the Ephemeris of 1767, to reduce them to proportional Logarithms. It will be more convenient to substitute proportional Logarithms of the Moon's Parallax instead of the logistic Logarithms in a future Ephemeris.

The Moon's right Ascension and Declination are useful to compute her Altitude at any Time, particularly at the Observation of her Distance from the Sun or a Star, supposing it was neglected to be or could not be observed properly; which latter Case may sometimes happen in the Night, though I think but rarely; the utmost Accuracy not being required for the Calculations of Refraction and Parallax. See British Mariner's Guide, Page 57. The Moon's Declination, with her Semidiameter and Parallax, serve for finding the Latitude by the Meridian Altitude of her upper or lower Limb observed at Sea. See British Mariner's Guide, Page 93. The Moon's right Ascension and Declination serve also to compute the Time from her Altitude observed at the Observation of her Distance from a Star; whence the Longitude may be inferred, though no Altitude of the Sun or a Star was taken for regulating the Time. See British Mariner's Guide, Page 61.

The Distances of the Moon from the Sun and fixed Stars, contained in the Four last Pages of the Month, are set down to every Three Hours of Apparent Time by the Meridian of Greenwich, and are designed to relieve the Mariner from the Necessity of a Calculation, which he might think prolix and troublesome, and to enable him, when compared with the same Distances observed carefully at Sea, to infer his Longitude readily and with little Danger of Mistake to a Degree of Exactness that may be thought sufficient for most nautical Purposes. But useful and valuable as the Practice of this Method may be at present, it is a Remark not unworthy our Notice, that there is Room to hope, by future Improvements of the Lunar Tables, and the Introduction of a more accurate Method of constructing Instruments, it may be carried to a much higher Degree of Perfection.

The Moon's Distance are computed both from the Sun and proper Stars, and generally from One Object on each Side of her, to afford the Mariner a greater Number of Opportunities of Observation, and a Means of attaining a greater Degree of Exactness. The Distances from the Sun

are computed between  $40^{\circ}$  and  $120^{\circ}$  of Distance. While the Moon is between the Distances of  $20^{\circ}$  and  $40^{\circ}$  from the Sun, her Distance is computed only from a Star on the contrary Side that the Sun is. When she is between the Distances of  $40^{\circ}$  and  $90^{\circ}$  from the Sun, her Distance is computed both from the Sun and from a Star on the contrary Side to the Sun; when the Moon is above  $90^{\circ}$  from the Sun her Distance is computed from Two Stars, one on each Side of her; though still her Distance is computed also from the Sun from  $90^{\circ}$  to  $120^{\circ}$ . Though the Distance of the Moon from the Sun or Star, well observed with a good Instrument, is sufficient to determine the Longitude, with the Help of the Ephemeris, always within a Degree, and generally much nearer, yet it will conduce to still greater Accuracy, if the Observer takes the Distance of the Moon from Two Stars, or the Sun and a Star, or, when the Moon is between  $90$  and  $120^{\circ}$  Distance from the Sun, from the Sun and Two Stars, if he can be so lucky as to obtain these several Observations.

The Longitude being computed from the Observations made with each Star respectively, the Mean of the Results is to be taken as probably approaching nearest to the true Longitude. In particular the Moon's Distance should be taken from Two Stars, or the Sun and a Star on each Side of her, as often as Opportunity permits, since the Mean of the Results will probably be at least as exact again as either separately, 1 mean as far as depends on any Imperfection of the Instruments, and unavoidable small Errors arising in the Use of them; Errors of these Kinds having a natural tendency to correct each other; for that small Error which arises from the lunar Tables will affect the Result from either Star equally. But the Error of Mr. Mayer's last lunar Tables here made use of, scarce ever exceeding  $1'$  at the most, and seldom amounting to  $20''$ . the Uncertainty hence arising in the Determination of the Longitude can scarcely exceed half a Degree, and generally will not exceed 10 Miles.

The Distances set down in the Ephemeris, afford the Observer a ready Means of knowing the Star from which the Moon's Distance is to be observed; for he has nothing to do but to set his Quadrant to the Distance computed roughly from the Ephemeris, neglecting the Seconds, at the apparent Time estimated nearly by the Meridian of Greenwich; and direct his Sight to the East or West of the Moon, according as the Distance at Greenwich is found in Page 9 and

15, or in Two last Pages of the Month; and having found the Moon upon the little Speculum, let him give a Sweep with the Quadrant to the Right and Left, and he will find the Star he seeks for, if above the Horizon and the Air be clear, nearly in a Line perpendicular to the Line of the Moon's Horns or longer Axis, or, which is the same Thing, in the Line of the Moon's shorter Axis produced. The Star is always one of the brightest, so that there is little Danger of mistaking another for it, if the preceding Directions are carefully observed. The Time at Greenwich is estimated nearly by turning the supposed Longitude from Greenwich into Time, by Table Page 6, 7, and 8, and adding it to or subtracting it from the Apparent Time at the Ship, as its Longitude is West or East of Greenwich. It will be sufficient if the Distance be computed from the Ephemeris within 10'. or 20'. for setting the Quadrant. The principal Use of the Distances of the Moon from the Sun and fixed Stars; namely, in determining the Longitude by Comparison with the corresponding Distances observed at Sea, will be shewn hereafter in its proper Order, in the Dissertation explaining the Method of computing the Longitude at Sea by the Help of the Ephemeris.

The Distances contained in the Ephemeris were computed strictly to Noon and Midnight, and thence interpolated for every Three Hours, according to the Method shewn for computing the Moon's Latitude, Page 17—19: Except that the Correction of second Differences at the Middle of the Interval to be interpolated, was taken  $\frac{1}{3}$  of the Mean of the Two second Differences, and at the first and third Quarter of the Interval was taken  $\frac{1}{2}$  of the Correction just found at the Middle of the Interval; instead of consulting Table Page 11, which would however have given the same Result. But, at the first 12 Hours when the Distances of the Moon from a Star begin, and the last 12 Hours when the Distances end, there being only One second Difference instead of Two second Differences on each Side to take a Mean of, this Method fails in these Cases, and therefore the following is to be substituted in its stead, being derived from Sir Isaac Newton's Solution of the Problem of drawing a Curve through the Extremities of any Number of given Ordinates. Phil. Nat. Princ. Math. Page 486. Edit. ult.

From Four Distances at Noon and Midnight computed strictly, to interpolate Three Distances at the 3d, 6th, and 9th Hour of the first or last Interval.

Subtract

Subtract each Distance from the following, for the first Differences, and prefix the Sign —, if the Distances decrease. Subtract each first Difference thus found from the following one of the same Order, for the second Differences: And in like Manner subtract the first 2d Difference from the following for the third Difference; applying the Signs as in algebraic Subtraction. Denote the first or last first Difference by  $b$ , the first or last second Difference by  $c$ ; according as the Interpolation to be made is for the first or last 12 Hours, denote also the third Difference by  $d$ ; and,  $a$  being put to signify the Distance at the Beginning of the Interval, the interpolated Distances will be as follows:

At 3d Hour of first Interval

$$a + \frac{1}{4}b - \frac{3}{32}c + \frac{1}{128}d$$

At 6th Hour of first Interval

$$a + \frac{1}{2}b - \frac{1}{8}c + \frac{1}{128}d$$

At 9th Hour of first Interval

$$a + \frac{3}{4}b - \frac{3}{32}c + \frac{5}{128}d$$

Or

At 3d Hour of last Interval

$$a + \frac{1}{4}b - \frac{3}{32}c - \frac{5}{128}d$$

At 6th Hour of last Interval

$$a + \frac{1}{2}b - \frac{1}{8}c - \frac{1}{128}d$$

At 9th Hour of last Interval

$$a + \frac{3}{4}b - \frac{3}{32}c - \frac{7}{128}d$$

In adapting these Formulæ to Numbers, great Care must be taken about the right Application of the Signs. Thus if  $b$ ,  $c$  or  $d$  is Negative, apply the Number expressing the Value of that Term of the Formula where it is found with a contrary Sign to that of the Formula.

Let me add in this Place, that if in filling up the first and last Intervals, a new second Difference has been supposed in arithmetical Progression with the Two given ones, in order to take a Mean between it and the first or last second Difference, the Interpolation at the Middle of the Interval or 6th Hour will be had true, the same as if the above Formulæ had been used: But at the Interpolation of the first and third Quarter there will be an Error of  $\frac{1}{128}$  third Difference; which will be corrected, by applying  $+\frac{1}{128}d$  or third Difference, to Number found at the first Quarter of the Interval, and  $-\frac{1}{128}d$  to that found at the third Quarter of the Interval; equally the same whether it be the first or last Interval.

N. B.

N. B. To the NAUTICAL ALMANAC of 1769 are annexed Instructions relative to the Observation of the Transit of Venus over the Sun's Disk on JUNE 3d, 1769: And to the NAUTICAL ALMANAC of 1771 are added Tables for finding the Latitude from Two observed Altitudes of the Sun, with the Interval of Time, measured by a Watch; and new Tables for computing the Eclipses of Jupiter's Third Satellite: And to the NAUTICAL ALMANAC of 1772 are annexed Two Methods for clearing the apparent Distance of the Moon from the Sun or a fixed Star of the Effect of Refraction and Parallax; and the Solution of a Problem in MERCATOR's NAVIGATION: And to the NAUTICAL ALMANAC of 1773 is added, A new Table of Equations to equal Altitudes; also, A Catalogue of the Places of 387 Fix'd Stars, in Right Ascension, Declination, Longitude, and Latitude, adapted to the Year 1770, with their Magnitudes and annual Variations in Right Ascension and Declination, calculated from the late Dr. Bradley's Observations: And to the NAUTICAL ALMANAC of 1774 are added, The Result of a Series of 10 Years Lunar Observations of Dr. Bradley, compared with a Set of manuscript Tables; Elements of Lunar Tables and Remarks on the Hadley's Quadrant, by the Astronomer Royal; a Problem for finding the Error in the Position of a Transit Telescope, and Two Examples of the Calculation of the Longitude from a Lunar Observation, &c. by Mr. Lyons.

\*\* Where may be had, ASTRONOMICAL OBSERVATIONS made at the ROYAL OBSERVATORY at Greenwich, from 1765 to 1769, by NEVIL MASKELYNE, Astronomer Royal, with TABLES for Reducing and Calculating ASTRONOMICAL OBSERVATIONS, by the same. Published by the President and Council of the Royal Society, in Obedience to his MAJESTY's Command, One Volume Folio. Price 15 s. in Sheets.
